1. Objective

To import data from a spreadsheet into ServiceNow using an Import Set and Transform Map. The Transform Map is used to map spreadsheet columns to fields in the target ServiceNow table and transform the imported data into the required format.

2. Prerequisites

- A ServiceNow instance with permission to create Import Sets and Transform Maps.
- A spreadsheet containing the data to be imported.
- A suitable target table in ServiceNow.
- The spreadsheet should have column headers that can be mapped to target-table fields.

3. Sample Spreadsheet Data

Number	Short description	Priority	State
INC1001	Laptop issue	2 - High	In Progress
INC1002	Email problem	3 - Moderate	New
INC1003	Network connection issue	2 - High	On Hold

4. Create the Import Set

1. Log in to the ServiceNow instance.

2. Navigate to All > System Import Sets > Load Data.

3. Select the spreadsheet file to import.

4. Choose the appropriate file format, such as Excel (.xlsx), if required.

5. Select or create the import set table.

6. Click Submit to load the spreadsheet data.

7. After the upload completes, open the created Import Set and verify the imported rows.

5. Create the Transform Map

1. Open the Import Set and select the option to create a Transform Map.

2. Enter a suitable Transform Map name, for example: Import Incident Spreadsheet.

3. Select the target table where the imported records should be created or updated.

4. Configure the required source and target fields.

5. Use field mappings to connect spreadsheet columns with ServiceNow table fields.

6. If needed, create Transform Map scripts for special data conversions or validation.

7. Save the Transform Map.

6. Field Mapping Example

Spreadsheet Column	Target Field	Mapping
Number	Number	Direct mapping
Short description	Short description	Direct mapping
Priority	Priority	Map/transform value as required
State	State	Map/transform value as required

7. Run the Transform

1. Open the Import Set record.

2. Review the imported rows before transformation.

3. Select the Transform option.

4. Select the required Transform Map.

5. Run the transform.

6. Review the transform results and confirm that records were inserted or updated successfully.

8. Verify Imported Records

- Open the target ServiceNow table.
- Search for the records imported from the spreadsheet.
- Verify that the mapped fields contain the expected values.
- Check for rejected, ignored, or failed rows in the Import Set/Transform results.
- Correct any mapping or data issues and rerun the transform if necessary.

9. Common Issues and Solutions

Issue	Solution
Column is not mapped	Check the source and target field mapping in the Transform Map.
Data type mismatch	Correct the spreadsheet value or use a transform script/conversion.
Records are rejected	Review Import Set and Transform logs for validation errors.
Duplicate records	Configure coalesce/identification fields when records need to be updated instead of inserted.

10. Test Case

Test Case ID	Scenario	Test Steps	Expected Result	Actual Result	Status
TC-001	Import spreadsheet data using Transform Map	Upload spreadsheet → create Import Set → map fields → transform → verify records	Spreadsheet records are correctly imported into the target table.	To be recorded during testing	Pass/Fail

11. Conclusion

Import Sets and Transform Maps provide a structured way to bring spreadsheet data into ServiceNow. By correctly mapping source columns to target fields and validating the transform results, imported records can be checked for accuracy and completeness.

12. UAT Notes

For UAT, test cases should cover both positive and negative scenarios, and testers should record actual results, defects, severity, status, and feedback. The supplied UAT materials specify these testing and sign-off elements.
